

Duka POS - User Guide

Running a shop counter on Duka POS: the till, inventory, reports and the demo sign-in.

Revision 1 - July 2026 | Abdikarim, Frontend Developer & Freelancer

Where to go

Duka POS

<https://duka-pos-urit.vercel.app>

The whole application - till, inventory and reports behind one sign-in.

Sign-in details

Email: abdkarimochieng@gmail.com

Password: #Abdik2109

Full access: selling at the till, editing inventory and reading reports.

Please read: These are shared demo accounts on a public deployment. Anyone reading this guide can sign in with them, so treat everything inside as throwaway sample data: do not enter real names, phone numbers, ID numbers or live payment details. Passwords are rotated from time to time - if one stops working, get in touch and I will send the current set.

1. What Duka POS is

Duka POS is a point-of-sale and inventory system for a small shop - a duka, a kiosk, a caf counter. It is the thing that sits between a customer handing over money and the shopkeeper knowing, at the end of the day, what sold and what is running out.

It runs in a browser, so the till can be a laptop, a tablet or a phone. Prices and totals are in Kenyan Shillings throughout.

- Dashboard - today's revenue, average sale, low-stock warnings, best sellers and recent transactions.
- Till - the selling screen: pick products, build an order, take payment.
- Inventory - the product list, prices, stock counts and total stock value.
- Reports - sales filtered by day or date range.

2. Signing in

1. Open the Duka POS address. The sign-in screen loads.
2. Enter the email and password from the credentials table at the front of this guide.
3. Press Sign In. You land on the dashboard.

Add the address to your phone or tablet home screen and it opens full-screen like an app, which is how it is meant to be used at a counter.

3. Reading the dashboard

The dashboard is written for a glance, not a study. It answers the questions a shopkeeper actually asks before opening.

- Revenue and average sale - today's takings and what a typical basket is worth.
- Low Stock Alert - items about to run out, so you reorder before a customer asks for something you do not have.
- Best Sellers by revenue - what is actually earning, which is not always what sells the most units.
- Slow Moving by quantity - stock sitting on the shelf tying up cash.
- Recent Transactions - the last few sales, with View All for the full list.

4. Making a sale

1. Open the till screen.
2. Narrow the product grid with the category buttons across the top, or search for an item by name.
3. Tap a product to add it to the order. Tap it again to increase the quantity.
4. The order panel on the right lists every line and the running total. Adjust quantities there, remove a line, or press Clear to start over.
5. Press CHARGE to take payment. The button stays disabled until there is something in the order.
6. Choose the payment method, confirm, and issue the receipt.

Completing a sale reduces stock for every item on it straight away, so the inventory count and the low-stock warnings stay honest without anyone updating them by hand.

5. Taking payment

- Cash - enter the amount handed over and the screen shows the change to give back.
- M-Pesa - enter the customer's number and send the prompt; they approve on their handset and the sale closes once it is confirmed.

Either way the sale is recorded with its payment method, so the day's report shows you the cash-versus-M-Pesa split rather than one undifferentiated total.

Payments run against the M-Pesa sandbox, not live Safaricom rails. An STK Push prompt will not appear on a real handset and no money moves; the demo simulates the callback so you can follow the full flow end to end.

6. Inventory

1. Open Inventory to see every product, its category, price and stock on hand. The header shows the total value of stock you are holding.
2. Add a product with its name, category, selling price and opening quantity. The category you choose is what appears as a filter button on the till.
3. Edit a product to change price or details. Existing sales keep the price they were made at.
4. Receive new stock by updating the quantity when a delivery arrives.

Set a sensible low-stock level per product. That number is what drives the Low Stock Alert on the dashboard - set it too low and you find out you are out of something from a customer.

7. Reports

1. Open the sales or reports screen.
2. Pick Today or Yesterday for the quick view, or set a custom date range.
3. Press Filter Reports to apply it.
4. Read off the totals, and open any individual transaction to see its lines and payment method.

Run the day's report before closing. It is the fastest way to check that the money in the drawer matches the cash the system says you took.

8. If something goes wrong

- CHARGE will not press - the order is empty. Add at least one item.
- A product is missing from the till - check its category filter, or confirm it exists and has stock in Inventory.
- Stock counts look wrong - a sale reduces stock the moment it completes. Compare against the day's transactions in reports before adjusting by hand.
- The M-Pesa prompt did not arrive - check the number is a Safaricom line in 07XXXXXXXX form and resend, or take the payment in cash and record it that way.
- The screen is stale - pull to refresh or reload the page. The till reads live data on load.
